Reviewing basic-layout

- Covering only common points
- Remember assignments are to **learn**
    - Not a "test"
    - Focusing on "it works" not helpful
        - Needs to use intended skills
    - You do it right through experience
    - Experience comes from doing it wrong

Common Issues!

- Not using material from class
- Loading CSS
- Where do I start?
- Failure to pad
- Clickable areas
- Won't shrink

Did you just Google/ChatGPT?

- The entire point was to use the lessons from class
- Work with the concepts as building blocks
- This teaches you more about
    - How things work
    - How to analyze what is happening
    - How to convert a need into code
- Did you ever open DevTools?

Loading the CSS

- Absolute path was a deliberate choice!
- People will include local file
    - `<link href="/Users/jorts/Documents/etc/etc/styles.css">`
    - Only works on your machine, with File => Open
- Absolute path requires web server
    - Requires it be run in correct folder
    - This was in instructions!
        - Details matter, read carefully!

Where do I start?

Most common, important question

I recommend a "top down" approach:

- Arrange the biggest, outermost elements
    - Positions, sizes
- Give those basics like padding, colors, typography
    - Don't worry about pieces inside yet
- Then take one of those and do the next inner layer
    - One layer at a time
    - Arrange, box model, colors, and text

Why this?

Two Goals:

- You want to break up into solvable problems
    - "Do it all" isn't solvable
    - "Arrange these child elements" is solvable
- You don't want to waste effort
    - Child first can look wrong after styling parent
    - May involve a bit of judgment
        - Move back and forth as helpful
    - Minimize work you have to redo
    - But doing work is better than being stuck
