Common Issues with js-intro

- 100vh
- ARIA

Past Issues

- `style` Attributes/Properties
- Not knowing `click` handles keyboard

Using 100vh

Many assignments using `min-height: 100vh;`

- Not required, but fine
- BUT mobile can have issues with 100vh
    - I taught in same lesson I taught vh
- TL;DR: Mobile browsers can have virtual controls
    - Cover part of the viewport
    - Fixed by using 100dvh
    - Not all browsers support dvh

```
min-height: 100vh; /* Fallback if no dvh */
min-height: 100dvh; /* Overrides if understood */
```

Suspicious Changes

A great many students used **ARIA**

- `aria-expanded`
- `aria-controls`

ARIA is good, but

- We haven't covered ARIA yet
- No one should use code they don't understand
